

Hybrid Deployment

Run IceWarp side by side with Microsoft 365 to **optimize your email and collaboration server and provide everyone with the features they need.** With both servers operating in a single domain, Hybrid Deployment is completely transparent to the user, considerably saving what you pay for email while giving power users the advanced functionality they rely on.

Cost-effective solution

Reduce your total costs by up to 50%. Pay only for what you really use and save your money.

Two systems. One domain.

Everyone keeps their email address and all of their history. The outside world will never know.

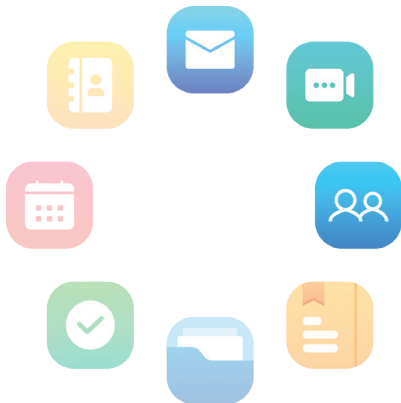

Cross-platform communication

Two servers on one domain. Yet everyone gets to work like nothing has changed.

Compatible with your clients

Keep using the clients you are used to. You can synchronize them, thanks to our support for standard protocols.

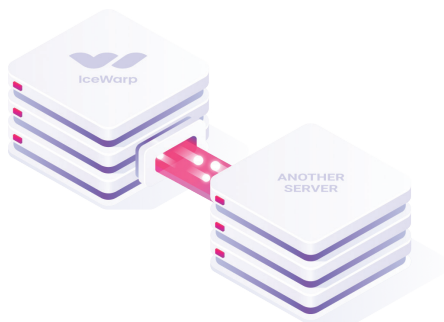

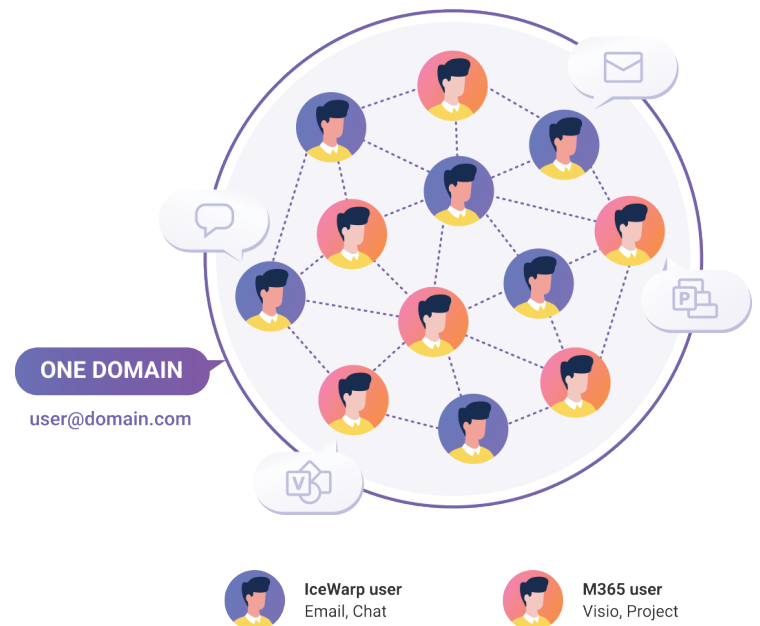

Why Hybrid Deployment

If your company is one of those businesses where 90% employees need only email and perhaps chat while advanced functionalities such as diagramming and project management are only required by about 10% users, you stand to save considerably. IceWarp can provide emailing, chat and conference capabilities for just a fraction of Microsoft 365 cost. And with everything running on a single domain, the operation is completely seamless.

How it works

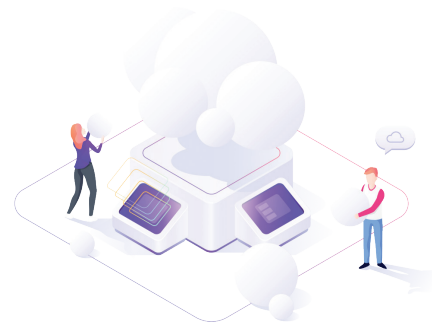

Hybrid deployment combines IceWarp with any email server you are using right now. They run side by side, on one domain, acting as one, looking as one for everyone outside of your company.

Usually only a minority of employees need the most advanced features. The rest is using only basic ones like email, documents editing or chat, and just a few of the semi-advanced ones. However you usually pay the same full price for all of them. This costs you way more more than necessary every month. Solution is simple, migrate those standard users to IceWarp, keep all the history and functions they need and save tens of percent of your regular costs.

Retain the Integrity

Both servers are connected and communicating together. Employees on IceWarp can chat with those on the original server while both using their own messengers, they have access to the same public folders as well as the same events and calendars. And for more effective team collaboration, both IceWarp and non-IceWarp users will have access to the same TeamChat rooms.

Cloud & On-Premises

Are you using your own infrastructure and email comes as a software for you? Do you prefer Cloud based services? Hybrid can be run on both, even combined. You can choose On-Premises for power users and Cloud for the rest, or vice versa. Whichever is more convenient for you.
